Universal Quantum Computer Simulation of 50 Qubits on Europe's First Exascale Supercomputer Harnessing Its Heterogeneous CPU-GPU Architecture

Hans De Raedt^a, Jiri Kraus^b, Andreas Hertel^a, Vrinda Mehta^{a,*}, Mathis Bode^a, Markus Hrywniak^b, Kristel Michiels^a, Thomas Lippert^a

^a Jülich Supercomputing Centre, Forschungszentrum Jülich, D-52425 Jülich, Germany
^b NVIDIA, Würselen, Germany

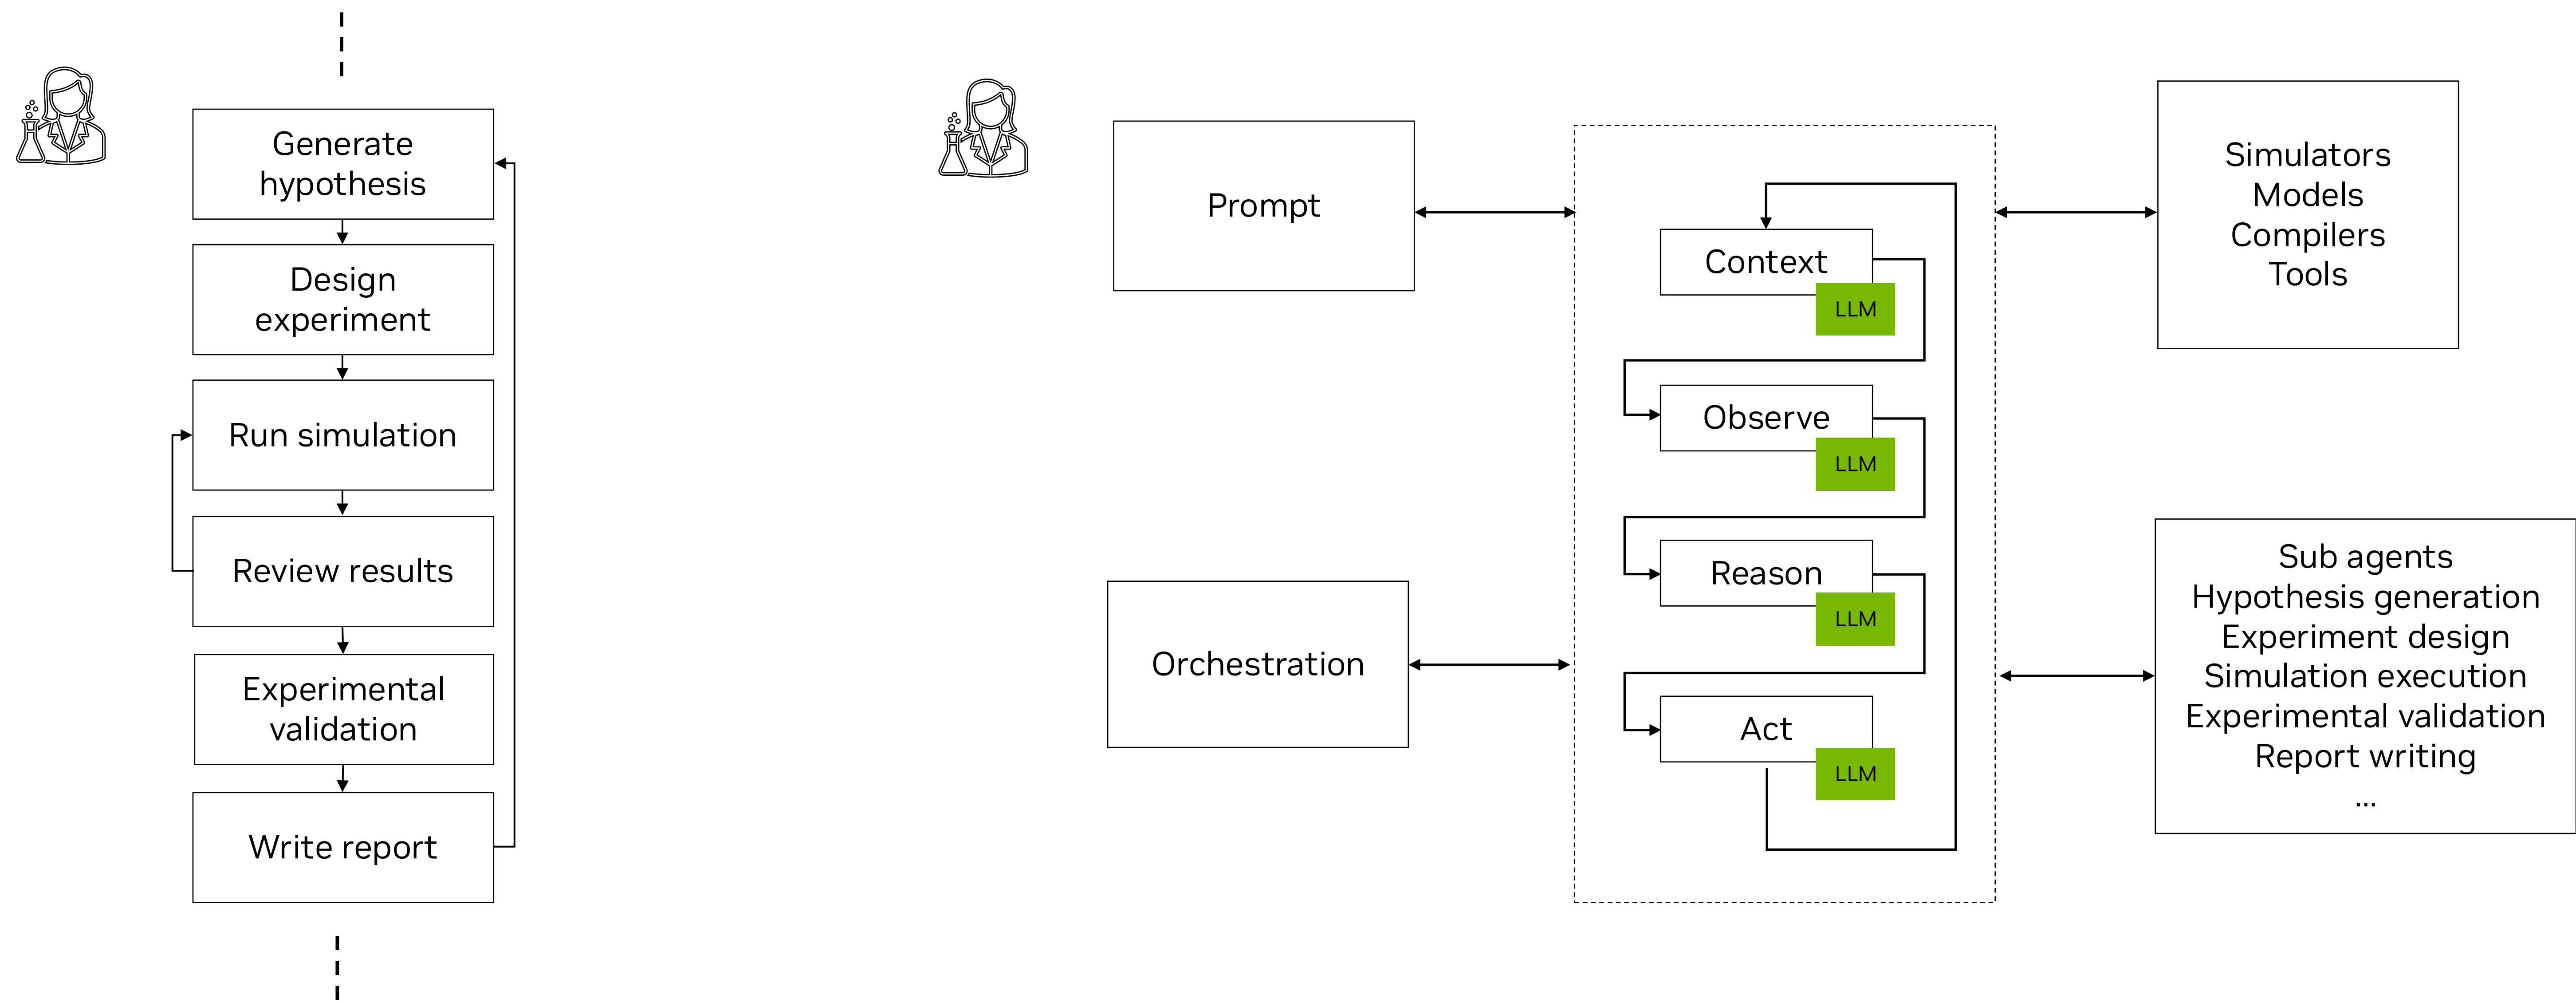

Abstract
We have developed a new version of the high-performance Jülich universal quantum computer simulator (JUQCS-50) that leverages key features of the GH200 superchips as used in the JUPITER supercomputer, enabling simulations of a 50-qubit universal quantum computer for the first time. JUQCS-50 achieves this through three key innovations: (1)

NVIDIA Agent Toolkit for Enterprise AI

Building Blocks for Specialized Agents

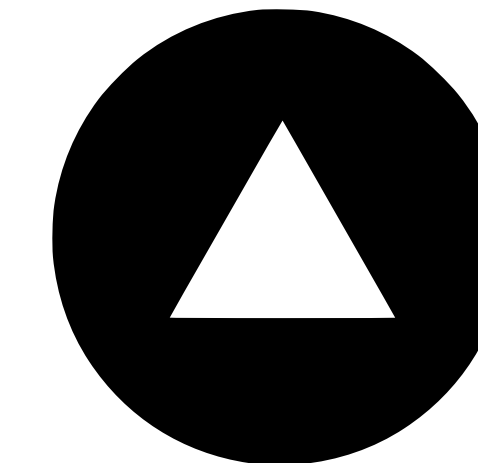

NVIDIA Libraries Available as Skills for Agents

github.com/NVIDIA/skills

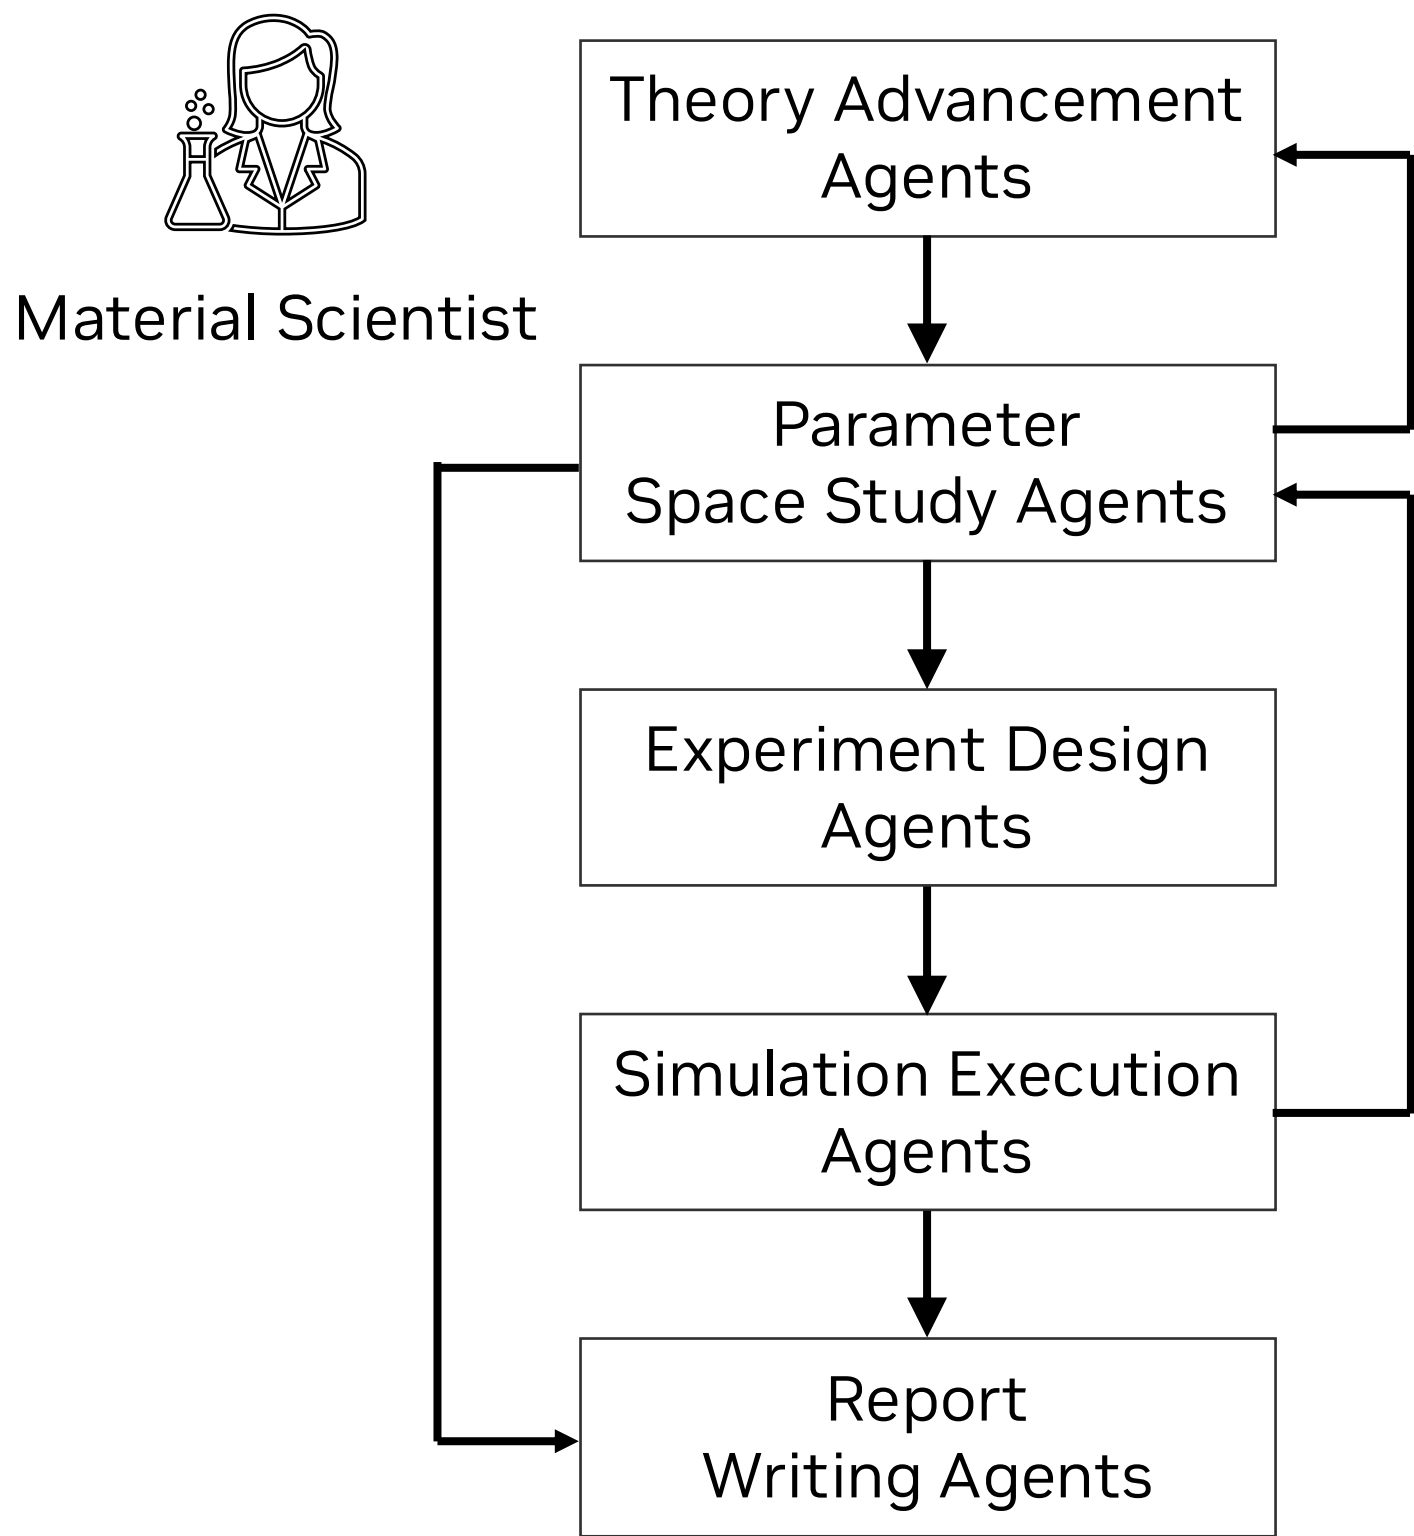

Available as plugins with your preferred agent:

LANL, University of Michigan, and Open AI Demonstrate URSA

- Agentic AI for Material Discovery

AI framework helps scientists plan, run, and analyze experiments connected to scientific foundation model (SciFM) surrogates

```
...
- The script established deterministic settings:
  - 'global.seed = 42'
  - 'numpy.seed = 42'
  - 'model.random.state = 42'
  - 'cv.shuffle = True'
  - 'cv.random.state = 42'
  - 'log.seed = 42'
  - 'surrogate.search.seed.sequence = "42 + round_id + ..."'

Other reproducibility rules:
- Manifests stored in dir 'log-8601' with '2' suffix
- hash raw input dataset bytes with SHA-256 and record it in manifests/logs
- serialized parameters in fixed order:
  - 'cat_id', 'cat_id', 'cat_id', 'cat_id'
  - store physics/logging numbers as JSON numeric values
  - for nonnumeric keys additionally store rounded-to-18-decimal canonical strings

what this step achieved relative to its success criteria:
- bounds explicit and unambiguous for every parameter: yes; exact historical min/max were selected for all 28
  parameters.
- expansion policy numerically/procedurally defined: yes; 5% default cap, 10% hard cap, explicit
  boundary-constraint triggers, explicit natural-domain guards, and failure-based values were established.
- logging field cover evaluation provenance and modeling metadata: yes; required fields for evaluation
  artifacts, manifests, model records, and candidate generation were fully specified.
- reproducible artifact/versioning convention established before modeling: yes; run IDs, round IDs, file
  conventions, hash policy, and deterministic seeds were defined.

Important unresolved points / caveats to remember:
- The conversation did NOT confirm creation of 'step2_bounds_logging.json'; only the script to produce it was
  written.
- No 'generated.json' was created in this step.
- No optimization, surrogate modeling, DDTF design generation, Pareto analysis, or final project artifacts were
  performed here; this step stayed strictly in setup.
- The assumed natural domain '[3,10]' for 'xax' and '[0.05,1.0]' for the other groups were
  numerically domain-inference choices, not confirmed by tool documentation.
- A default MCP evaluation in this step returned different values from the earlier step's default MCP evaluation;
  later steps should verify whether the tool is stochastic, versioned, or state-dependent.
- The step established serialization and key rules, but no real evaluation log implementation was yet executed
  against them.

Files created/modified during this step:
- Created: 'step2_defining_bounds_logging.py'
- Included output when run later: 'step2_bounds_logging.json' (not confirmed created in transcript)

Best concise handoff for the next executor:
- No 'step2_bounds_logging.json' or 'generated.json' to be materialized; confirmation of initial bounds, expansion logic, logging
  schema, artifact conventions, and seed policy.
- Initial optimization bounds should be the exact historical min/max for all 28 parameters listed above.
- Full evaluation should use 'surrogate_model', duplicate using 'cat_id' == 'e-9' / 10-decimal canonical rounding.
  Note: transient MCP failures at most once, and log all attempts immediately with the required fields.
- All manifests and logs should include the full log_id.
- Before proceeding, run 'step2_defining_bounds_logging.py' to materialize 'step2_bounds_logging.json' and then
  approximate taken before: 5422s
  approximate taken after: 3702s
...

```

Components in NVIDIA Agent Toolkit

Open stack for building and running enterprise AI agents

OPEN MODELS

Nemotron

Open models for reasoning, safety, and multimodal intelligence.

NIM

Optimized inference microservices that expose models through standard APIs.

Dynamo

Distributed inference orchestration for efficient, scalable model serving.

AGENT TOOLS & SKILLS

NeMo RL & NeMo Gym

Reinforcement learning and scalable environments for post-training, rollouts, and evaluating agent behavior.

NeMo Relay

Control and observability layer for agent runs, tool calls and LLM calls across existing frameworks.

NeMo Switchyard

Task-aware model routing across endpoints to optimize quality, latency and cost.

Omniverse

Libraries for physical AI, simulation, and 3D workflow automation.

BioNeMo

Libraries for life sciences, enabling agents for drug discovery, protein structure prediction, and genomics workflows.

PhysicsNeMo

Open framework for scalable physics AI models for science and engineering.

BLUEPRINTS

NemoClaw

Blueprints for custom, super agents that turn your company's proprietary intelligence, data and domain expertise into action.

AI-Q

Enterprise AI knowledge engine that connects agents to structured and unstructured data – making it understandable, and predictive.

SECURE RUNTIME

OpenShell

Policy-based controls for privacy, networks, tools, files, and code execution.

OpenCode + VSCode / JupyterLab + NCHC RAP LLM API / NVIDIA NIM + Nemotron

讓 OpenCode Agent 善用 NVIDIA Agent Toolkit 的 Skills (CUDA-X) 完成任務

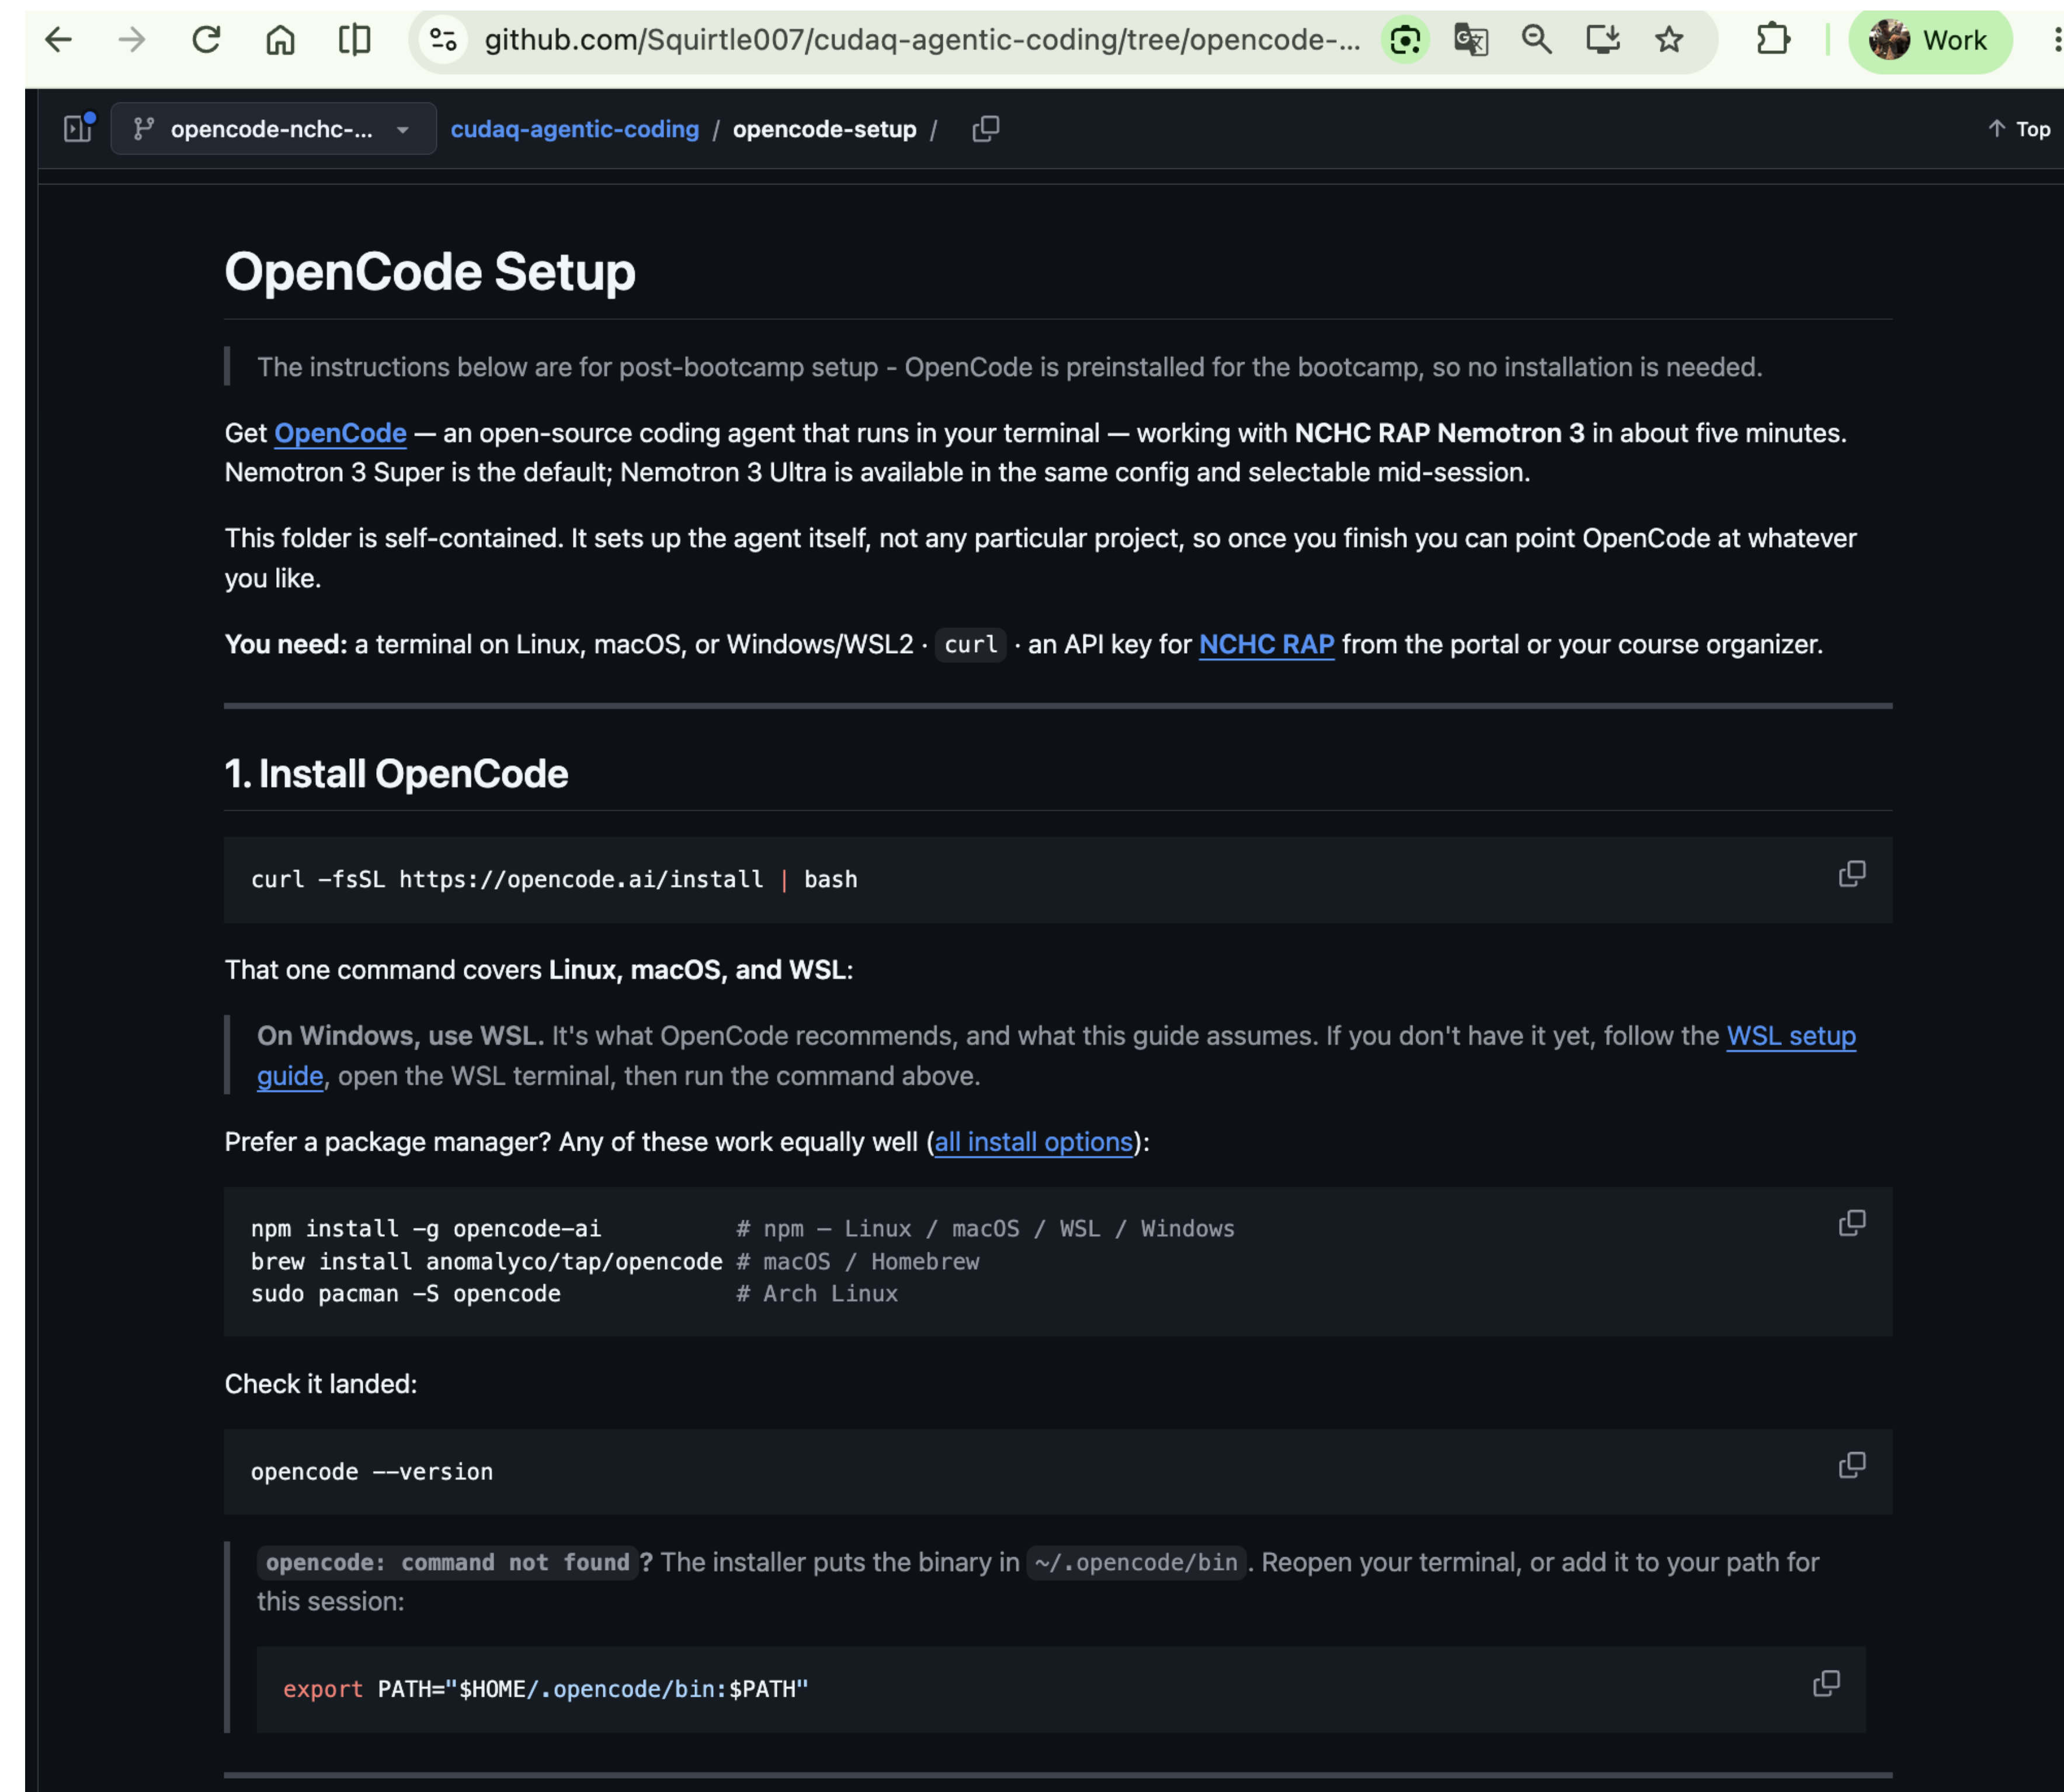

Get a LLM API Key on NCHC RAP

More setup details are open-sourced

<https://github.com/Squirtle007/cudaq-agentic-coding/tree/opencode-nchc-rap/opencode-setup>

The screenshot shows a GitHub repository page for 'opencode-setup' by user 'Squirtle007'. The page title is 'OpenCode Setup'. The content includes instructions for post-bootcamp setup, stating that OpenCode is preinstalled for the bootcamp. It describes OpenCode as an open-source coding agent that runs in the terminal, working with NCHC RAP Nemotron 3. The folder is self-contained and sets up the agent itself. Requirements include a terminal on Linux, macOS, or Windows/WSL2, and an API key for NCHC RAP. The page lists installation options: a single curl command, or using package managers like npm, brew, or pacman. It also includes a section for checking the installation with 'opencode --version' and a command to set the PATH environment variable.

OpenCode Setup

The instructions below are for post-bootcamp setup - OpenCode is preinstalled for the bootcamp, so no installation is needed.

Get [OpenCode](#) — an open-source coding agent that runs in your terminal — working with **NCHC RAP Nemotron 3** in about five minutes. Nemotron 3 Super is the default; Nemotron 3 Ultra is available in the same config and selectable mid-session.

This folder is self-contained. It sets up the agent itself, not any particular project, so once you finish you can point OpenCode at whatever you like.

You need: a terminal on Linux, macOS, or Windows/WSL2 · `curl` · an API key for [NCHC RAP](#) from the portal or your course organizer.

1. Install OpenCode

```
curl -fsSL https://opencode.ai/install | bash
```

That one command covers **Linux, macOS, and WSL**:

On Windows, use WSL. It's what OpenCode recommends, and what this guide assumes. If you don't have it yet, follow the [WSL setup guide](#), open the WSL terminal, then run the command above.

Prefer a package manager? Any of these work equally well ([all install options](#)):

```
npm install -g opencode-ai      # npm - Linux / macOS / WSL / Windows
brew install anomalyco/tap/opencode # macOS / Homebrew
sudo pacman -S opencode        # Arch Linux
```

Check it landed:

```
opencode --version
```

`opencode: command not found` ? The installer puts the binary in `~/ .opencode/bin` . Reopen your terminal, or add it to your path for this session:

```
export PATH="$HOME/.opencode/bin:$PATH"
```

3-minute Feedback Survey

Thank you for participating in the Bootcamp. Your feedback helps us improve future events and services. Please take a few minutes to share your thoughts.

SINICA NCHC CUDA-Q Agentic Coding Bootcamp

關鍵議題研究中心
Research Center for Critical Issues

SINICA NCHC CUDA-Q AGENTIC CODING BOOTCAMP

Hands-on training on NVIDIA Quantum Platform, hybrid quantum-classical workflows, and agentic AI for real quantum hardware.

 2026/8/7 (五)
9:30-16:20

 中央研究院南院
關鍵議題研究中心1F演講廳

AGENDA

09:30-10:00	Registration & Setup	
10:00-10:15	Opening	Academia Sinica 陳啟東教授
10:15-10:45	NVIDIA Quantum Platform Overview: CUDA-Q & NVIDIA Ising	NVIDIA Pika Wang
10:45-11:15	NVIDIA CUDA-Q Environment Setup	
11:15-12:00	Basic CUDA-Q Hands-on + Ising Calibration Playground (NIM)	
12:00-13:00	Lunch Break	
13:00-14:00	Superconducting QPU Introduction & Agentic Calibration	Academia Sinica 陳啟東教授 NCHC 李泰岳博士, 何明鋼博士
14:00-14:10	NCHC Tech Sharing	NCHC 李泰岳博士
14:10-14:20	Agentic Coding with NCHC RAP Service	NVIDIA Jay Chen
14:20-14:40	Tea Break	
14:40-15:20	Advanced CUDA-Q Hands-on with RAP	NVIDIA Pika Wang
15:20-16:00	Bring-Your-Own-Code with CUDA-Q Agentic Programming	
16:00-16:20	Q&A + Open Discussion	Q&A
